                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                      The invention relates to new peptides comprising 3-30 contiguous amino acids from the N-terminus of the protein SNAP-25 (synaptosomal-associated protein 25). The peptides AAB15581-B15586 represent examples of the peptides of the invention. The peptides have neuronal exocytosis inhibitory activity and are used for treatment of factal wrinkles and asymmetry and pathological neuronal exocytosis-mediated pathological disorders and alterations manifested e.g. by spasms and neurological and neurodegenerative disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence corresponds to residues 187-206 of the human 25 kD CC synaptosomal associated protein (SNAP-25), and is a inhibitory agent of the invention. The agents of the invention inhibit secretion of CC the invention. The agents of the invention inhibit secretion of CC correspond substantially to any one of AAW30097-W30102, or more CC uncoupling peptide (I) of at least 20 amino acids (aa) all of which CC correspond substantially to any one of AAW30097-W30102, or more CC denerally any (I) that inhibits 50% of catecholamine secretion from CC bovine chromaffin cells at a concentration of 10 microM, especially 0.25 microM, or less. (I) are used, as a replacement for Clostridium toxin, to CC inhibit release of neurotransmitters from synaptic vesicles, specifically CC for reducing muscle spasticity. Also (I) may be labelled to allow in CC vivo imaging of intracellular distribution of (I). Compounds for CC delivering the drug to neural cells provide targeted drug delivery, e.g. CC delivering the drug to neural cells provide targeted drug delivery, e.g. CC available. Their therapeutic effect lasts for several days or weeks, so consider the constant and content are required.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

(I) are used, as a replacement for Clostridium toxin, to inhibit release of neurotransmitters from synaptic vesicles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of substance P to brain tumours for induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or induction of apoptosis. Their therapeutic effect lasts for several days or weeks, so lower doses or less frequent treatments are required.

(I) are used, as a replacement for Clostridium toxin, to inhibit release of neurotransmitters from synaptic vesicles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering the drug to neural cells provide targeted drug delivery, e.g. of substance P to brain tumours for induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or immunogenic and are more readily available. Their therapeutic effect lasts for several days or weeks, so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence corresponds to residues 170\text{-}206 of the human 25 k synaptosomal associated protein (SNAP-25), and is a inhibitory the invention. The agents of the invention inhibit secretion of

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The botulinum neurotoxins possess highly specific zinc-endopeptidase activities within their light sub-units. Depending on the neurotoxin type these act to cleave small proteins within the nerve cell which are involved in neurotransmitter release. Antibodies are used in assays which detect cleaved but not uncleaved substrate. Assays for botulinum types A and E use the present sequence as a substrate. The sequence is SNAP-25 protein, residues 137-206.

```
The invention comprises clostridial neurotoxin substrate peptides which can serve as fluorescence resonant energy transfer assay (FRET) or quenched-signal substrates in assays for the proteolytic activities of clostridial neurotoxins. The invention further comprises clostridium botulinum neurotoxin substrate peptides that can serve as immobilised substrates (i.e. bound to a solld phase) in assays for the proteolytic activities of clostridial neurotoxins. The clostridial (including the Clostridium botulinum) neurotoxin substrate peptides are useful for detecting the presence of clostridial neurotoxins in a sample (e.g. food or an environmental sample). The present amino acid sequence represents clostridial neurotoxin substrate peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Clostridial neurotoxin substrate; botulinum neurotoxin substr fluorescence resonant energy transfer assay; quenched-signal; clostridial neurotoxin detection; food.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                represent examples of the peptides of the invention. The peptides have neuronal exocytosis inhibitory activity and are used for treatment of facial wrinkles and asymmetry and pathological neuronal exocytosis mediated pathological disorders and alterations manifested e.g. by spasms and neurological and neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                         clostridial neurotoxin,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                              neurotransmitters from synaptic vesibles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging intracellular distribution of (I). Compounds for delivering the drug neural cells provide targeted drug delivery, e.g. of substance P to brain tumours for induction of apoptosis. Unlike the neurotoxins, (I) not toxic or immunogenic and are more readily available. Their therapeutic effect lasts for several days or weeks, so lower doses or
                                                                                                                                                                                                                                                                                                                                                                                               and is an excitation-secretory uncoupling peptide (I) of at least 20 amino acids (aa) all of which correspond substantially to any one of AAW30097-W30102, or more generally any (I) that inhibits 50% of catecholamine secretion from bovine chromaffin cells at a concentration of 10 microw, especially 0.25 microw, or less. (I) are used, as a replacement for Clostridium toxin, to inhibit release of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the human 25 kD synaptosomal associated protein (SNAP-25), which is an inhibitory agent of the invention. The agents of the invention inhibit secretion of neurotransmitter from neuronal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Excitation-secretory uncoupling peptide(s) for inhibiting neuro:transmitter release - used particularly for treating muscle spasticity, and for delivering drugs specifically to neural cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction; synaptosomal associated protein; SNAP-25.
                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 27-28; 61pp; English

                                                                                                                                                                                                                                                                                                        This represents a mouse SNAP-25 polypeptide, a component of the protein polypeptides thought to underlie vesicle docking and fusion. The invention provides rat and human Hrs-2 polypeptides which are ATP-preferring nucleotidase that associate with SNAP-25. For identifying a compound capable of modulating calcium-regulated secretion of secretory vesicles, a SNAP-25 polypeptide can be contacted with a Hrs-2 polypeptide, in the presence and absence of a test compound. The effect of the test compound on the extent of binding between the SNAP-25 and Hrs-2 polypeptides are measured and a compound is identified as effective if its measured effect on the extent of binding is above a threshold level. The products can be used for identifying drugs capable of a fection and a contactor wrongers with a polypeptide of the contactor of the contactor of the capable of the secretory processes.
                                                                                                      of the brain, including affective disorders (e.g. depression), disorders of thought (e.g. schizophrenia) and degenerative disorders ( Parkinson's disease), as well as applications such as anaesthesia. The drugs can also be used therapeutically in other systems such as the endocrine system for treatment of hormonal imbalances, the immune system for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hrs-2 polypeptide; ATP-preferring nucleotidase; SNAP-25; vesicle docking; calcium-regulated secretion; secretory vesicle; secretory process; brain; neurotransmitter release; presynaptic membrane; CNS disorder; depression; parkinson's disease; endocrine system; hormonal imbalance; cell division; thought disorder; schizophrenia; degenerative disorder; anaesthesia; rat;
                                                                                                                                                                                                                    affecting secretory processes, such as neurotransmitter release at the active zones of presynaptic membranes. Such drugs can be used for treating disorders or conditions of the central nervous system by selectively enhancing or inhibiting vesicular release in specific areas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 16; Pages 42-44; 55pp; English

                                                                                                                                                                                                  protein of 25 kD (SNAP-25). The invention relates to a method for identifying a compound capable of affecting the binding of a syntaxin binding protein (SBP), e.g. SNAP-25 alpha-SNAP, n-sec1 or VAMP, to syntaxin. The method comprises measuring the effect of the test compound on the extent of binding between the SBP and the SBP-binding site on syntaxin. The method can be used for identifying drugs capable of inhibiting or stimulating neurotransmitter release at the active zones of presynaptic membranes, which may be useful for treating CNS disorders, affective or psychotic disorders, neurodegenerative diseases, hormonal or immunological disorders or tumours.
                                                                                                                                                                                                                                                                                                                         This amino acid sequence represents the mouse synaptosomal-associated protein of 25 kD (SNAP-25). The invention relates to a method for

CC attachment protein receptor) to a cell of the patient, where the SNARE is cresistant to protein receptor) to a cell of the patient, where the SNARE is creabable of inhibiting the toxin (toxin-resistant SNARE) and/or is capable of inhibiting the toxin (toxin-resistant SNARE) and/or is ceapable of inhibiting the toxin (toxin-resistant SNARE). The protein can be used in a method of treating a patient in need of inhibition of SNARE. CC dependent exocytosis from a cell capable of performing SNARE-dependent ce exocytosis, comprises supplying a fragment, variant, fusion or derivative co of a SNARE or an inhibitory SNARE to the cell of the patient. The toxin cresistant or toxin inhibitory SNARE to the cell of the patient. The toxin cresistant or toxin inhibitory SNARE or a recombinant polynucleotide control of a patient suffering from poisoning or at risk of poisoning control of the suffering from botalism or tetanus. The fragment, control of crecombinant polynucleotide encoding either of these SNARE polypeptides care useful in the manufacture of medicament for the treatment of a cell capable of performing SNARE-dependent exocytosis from a cell capable of performing SNARE-dependent exocytosis. The method of treatment control of a state of the symptoms when most severe and capable of the nation of the sations of the symptoms when most severe and control of the symptoms when most severe and capable of the nation of the sations of the symptoms when most severe and capable of the nations of the symptoms when most severe and capable of the nations of the symptoms when most severe and capable of the nations of the symptoms when most severe and capable of the symptoms w
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      associated protein, SNAP25. The sequence was used to create SNAP-25 double/single point mutants and C-terminal demonstrates used in a new method of treating a patient suffering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating a patient suffering from poisoning or at risk of poisoning a clostridial toxin, e.g. botulism, comprises administering a toxin-resistant or toxin-inhibitory SNARE -
Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            poisoning or at risk of poisoning by a clostridial toxin, comprising supplying a SNARE (soluble (N-ethylmaleimide-sensitive fusion protein)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cleavage-site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Key

AAU00252
The sequence represents the amino acid sequence of SNARE homologue, CC synaptosomal-associated membrane protein, hSNAP25a, used during analysis of SNAP-25 SNAP-25 mutants were used in a new method of treating a CC patient suffering from poisoning or at risk of poisoning by a clostridial toxin, comprising supplying a SNARE (soluble (N-ethylmaleimide-sensitive fusion protein)-attachment protein receptor) to a cell of the patient, CC where the SNARE is resistant to proteolysis by the toxin (toxin-resistant CC SNARE) and/or is capable of inhibiting the toxin (toxin-inhibitory CC SNARE) and/or is capable of inhibiting the toxin (toxin-inhibitory CC SNARE). The protein can be used in a method of treating a patient in need of inhibition of SNARE-dependent exocytosis from a cell capable of performing SNARE-dependent exocytosis, comprises supplying a fragment, CC variant, fusion or derivative of a SNARE or an inhibitory SNARE to the cell of the patient. The toxin resistant or toxin inhibitory SNARE or a recombinant polynucleotide encoding the SNARE is useful in the poisoning or at risk of poisoning by clostridial toxin, e.g. from CC manufacture of an inhibitory SNARE, or a recombinant polynucleotide encoding CC either of these SNARE polypeptides are useful in the manufacture of medicament for the treatment of a patient in need of inhibition of SNARE. CC elevations the streatment of a patient in need of inhibition of SNARE. CC alleviating the symptoms when most severe and taking the patient out of critical state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SNAP-25; poisoning; clostridial toxin; SNARE; toxin-resistant SNARE; toxin-inhibitory SNARE; botulism; tetanus; SNARE-dependent exocytosi synaptosomal-associated protein; hSNAP25a; human; N-ethylmaleimide-sensitive fusion;

                         N Res. 4:215-230(1997).
FUNCTION: Vesicle trafficking protein that functions in the secretory pathway (By similarity).
SIMILARITY: BELONGS TO THE SNAP-25 FAMILY.
SIMILARITY: Contains 1 t-SNARE coiled-coil homology domain.
                                                                                                                                                                                                                                                                                                                                                                                        ARATH

II. FUNCTION: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2

HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)

AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

SUBCELLULAR LOCATION: TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING

CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,

CHARACTERISTIC FOR ALPHA HELICAL COILED COILS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      McNailly E.M., Kraft R., Bravo-Zehnder M., Taylor D., Leinwand L.A.; "Full-length rat alpha and beta cardiac myosin heavy chain sequences. Comparisons suggest a molecular basis for functional differences."; J. Mol. Biol. 210:665-671(1989).
